

Lightning Location with LINET Technology

Methodology and Performance

Hans D. Betz

University of Munich, Germany (Atmospheric Electricity Research)

nowcast GmbH, Germany (Operational Network)

10th AGILE Workshop, 18 April 2012, Frascati, Italy

Measurement of Radioactivity with BfS-Counters in Germany

(BfS operates ~4000 monitoring sites)

Lightning Strokes during Counter Responses

Result: clear correlation between lightning impact and counter response
only **particle showers** could have triggered the final counter report

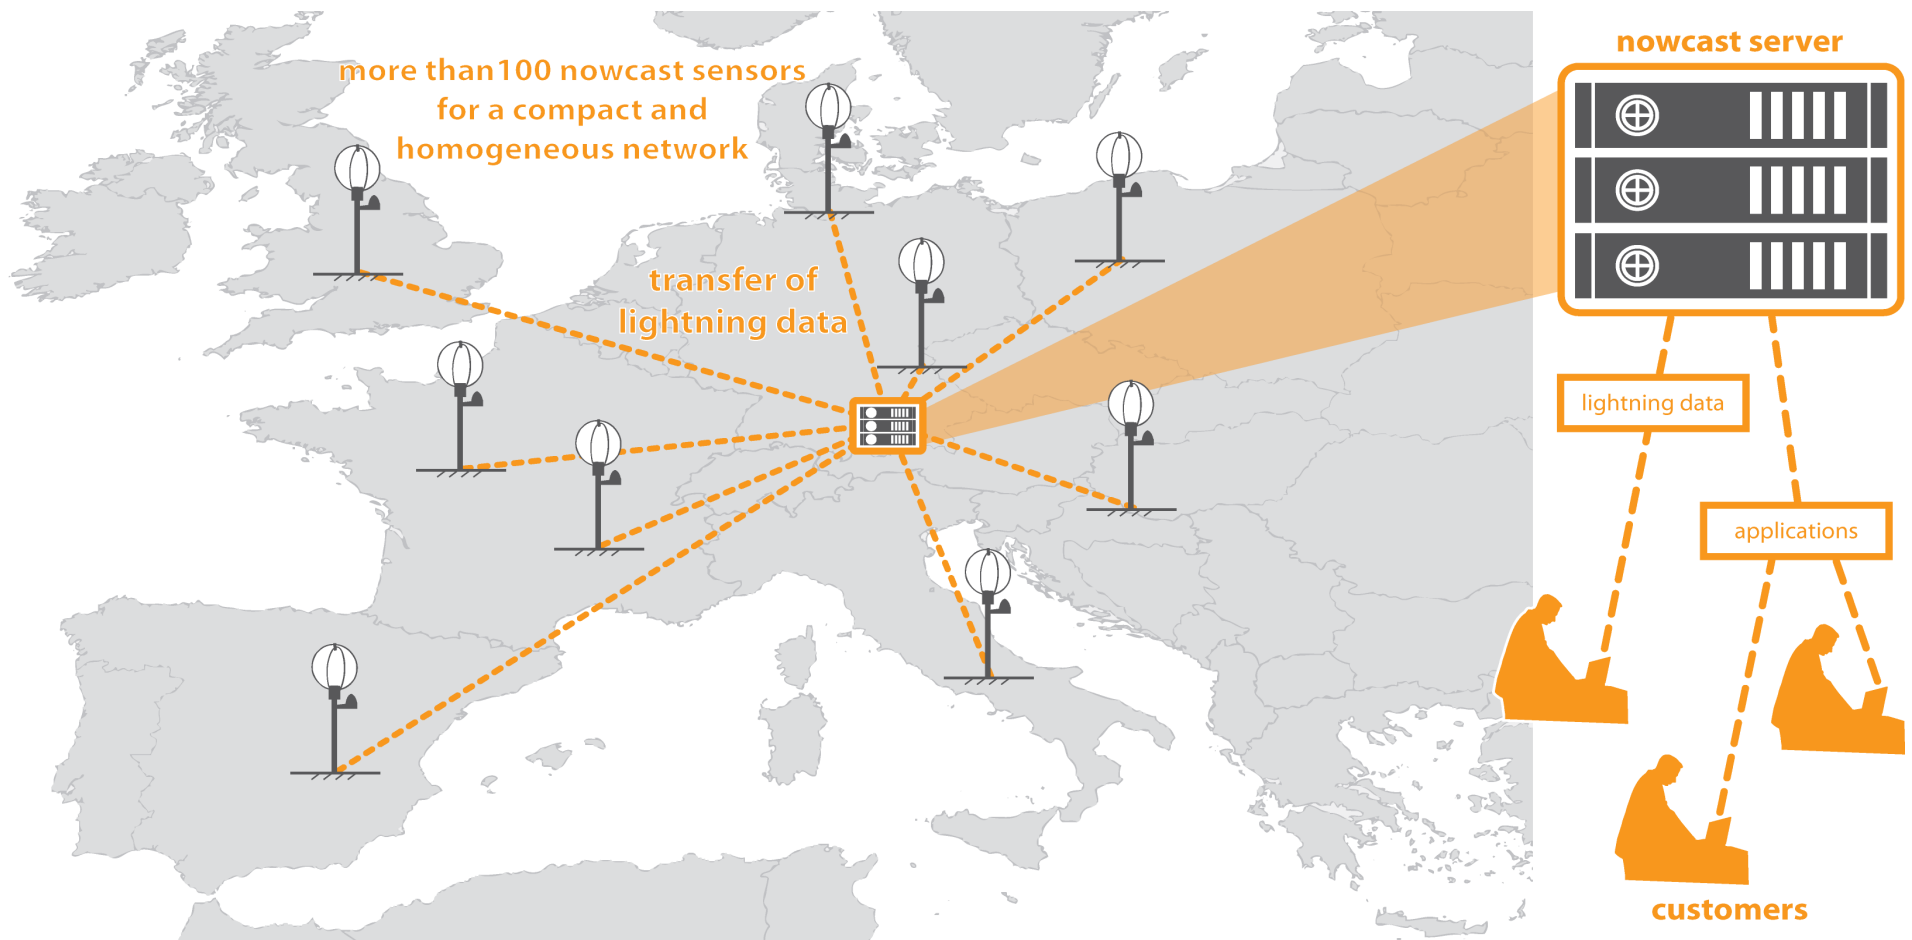

Gamma Counter (design for monitoring of enduring radioactivity in the air):

Geiger-Müller for $0,02 - 2 \cdot 10^7 \mu\text{Gy/h}$ and $40 \text{ keV} - 2 \text{ MeV}$; dead-time $22 \mu\text{s}$; positioned 1 m above ground

Logged response requires minimum dose and minimum pulse rate (no response for a single particle)

Modules:

- Field Antenna
- GPS Antenna
- Field Processor
- Central Processing / Monitoring

The sensor-sites demonstrated in the graphic above do not correspond to real locations.

LINET Detection Principle

- | | |
|--|------------------------|
| - VLF/LF frequency range | long range |
| - magnetic flux | less disturbance |
| - direct measurement of H_x and H_y | higher sensitivity |
| - no dead-time | no loss of signals |
| - analysis of all pulses irrespective of pulse shape | no loss of strokes |
| - single technique for ground- and cloud lightning | total lightning |
| - Fourier analysis and filter for ,technics‘ | noise reduction |
| - TOA (time-of-arrival) for locating strokes | accuracy, less scatter |
| - 3D stroke type discrimination in central analyzer | enhanced reliability |

LINET – high-precision Lightning Detection.

Total Lightning

Reliable distinction between intra-cloud (IC) and cloud-to-ground (CG) strokes (3D-locating)

Stroke Detection Efficiency

Unparalleled efficiency: more than 90% of ground strokes are detected with sensor-baselines ~250 km

Location Accuracy

High location accuracy with an average statistical location error of down to ~100 m only minor scatter of locations

LINET in Europe

Broadband measurements and network results

LINET detects and locates the weak stroke, labelled UI (Upward Illumination).

No other network was able to locate this type of ground stroke; these were:

NLDN, CGLSS, LDAR2

Other flash example for the same phenomenon

High-Speed Video for Stroke Verification

After a strong return stroke (left) a weak ground stroke occurs after 2 ms and several km in a separate left of the previous return stroke (positions marked by the arrows)

VHF and VLF/LF Emission
